

## Operating principle

When a container of some ingredients is revolved, the centrifugal force separates air bubbles from the ingredients because their specific gravity is different. While the container is revolving, however, it is also rotated at a certain ratio. This generates centripetal force to mix the ingredients. Such sophisticated interaction, where both centrifugal and centripetal forces are generated simultaneously, achieves the mixing and defoaming operations at the same time.

1. Mixing mode LED

You can set the mixing time while this LED turns ON.
